Learn Beyond Classroom

Traditional education hasn't kept up with the future.
thinkskool bridges that gap.

THINKSKOOL SUMMER BUILDER PROGRAM

1 Months | Live Classes | Real Projects | thinkskool Certification

THINKSKOOL SUMMER BUILDER PROGRAM

(1-MONTH PROGRAM)

For Class 7 to 12

This program is focused on one goal:

Turning students from **beginners** into **builders**.

Students will not just learn concepts. They will write code, use AI tools, build systems, and present real projects.

PROGRAM STRUCTURE :

30 Days

DURATION

60 mins

DAILY SESSION

Online

MODE

7 to 12

CLASSES

HOW STUDENTS LEARN (MODEL)

1

UNDERSTAND

Learn concepts in simple way

2

PRACTICE

Apply through guided exercises

3

BUILD

Create real working projects

4

PRESENT

Showcase final output

What Your Child Will Build

4 weeks · 24 live classes · Foundations of AI & ML

Python Mastery

Write real Python programs with loops, functions, classes and libraries — zero to fluent in 1 weeks.

AI & ML Skills

Build real ML models, connect to the OpenAI API and learn to use AI as a professional tool.

Deployed Projects

Ship a face recognition system, a web app and 8+ mini-projects you can show the world.

The Skills Gap - and Your Opportunity

Most students have

- ✗ Watched YouTube coding tutorials
- ✗ Academics theory, no real projects
- ✗ No idea how AI actually works
- ✗ Never shipped anything live

thinkskool student have

- ✓ Built & deployed real Python apps
- ✓ Working ML models from scratch
- ✓ Integrated live APIs and AI tools
- ✓ Presented live to a real audience

Course Completion Certificate

Awarded on Demo Day after the live project presentation

Certificate of Completion
Foundations of AI & ML

WEEK 1 : FOUNDATIONS OF SOFTWARE DEVELOPMENT

Remove the fear. Start building from day one.

Most students arrive thinking software development is not for them. By the end of this week they have written real programs that take input, make decisions and produce output. The fear is gone

What gets covered :

What programming actually is

Explained through real life examples students already understand. No textbook definitions. No history lessons. Students write and run their first program on the very first day.

Conditions and decision making.

Students build an even or odd checker, then upgrade it to a full marks to grade converter that handles multiple conditions.

Loops.

For loops used to print patterns and multiplication tables. While loops used to build a password retry system that locks after failed attempts. Students see immediately how loops make programs powerful.

Variables and input output.

Students build a program that takes a user's name and details and produces a personalised output. Simple but effective at building confidence.

END OF WEEK PROJECT:

A fully functional MCQ based quiz game

Students build it themselves, question by question. By Friday they have something they can show someone and explain how it works.

WEEK 2 : BUILDING REAL APPLICATIONS

Students stop writing small programs. They start building complete applications.

Week two is where things click. Students learn how to structure code properly, handle real data and save information that persists. By the end of this week they have built a complete working application from scratch.

What gets covered :

Functions and reusable code.

Students learn why functions matter and build a working calculator that uses them properly. Then they build a reusable utility function they can plug into any project.

Lists and dictionaries.

Students build a student marks tracker using lists, then move to dictionaries to store and retrieve structured user data. They understand how real applications store information.

File handling.

Students save data to a file and retrieve it later. This is the moment they realise their programs can have memory. The task is saving user data that survives after the program closes.

Combining everything.

Students take everything from the week and connect it into one system. A contact book that stores names, numbers and details, saves them to a file and retrieves them on demand.

END OF WEEK PROJECT:

A complete contact book application

A complete contact book application with full save and retrieve functionality. Students have now built something genuinely useful.

WEEK 3 : AI TOOLS AND SMART APPLICATIONS

Students stop wondering how AI works. They start using it to build.

Week three shifts gears. Students are introduced to AI tools, APIs and how modern applications actually work. This is not a theoretical introduction to artificial intelligence. Students use real tools, build real things and finish the week with a working chatbot they built themselves.

What gets covered :

Introduction to AI tools in real use.

Students use AI to generate, edit and improve content. They see immediately how these tools work and where they fall short. The task is practical, not conceptual.

Prompt engineering.

Students learn that how you ask matters as much as what you ask. They write and compare prompts, see the difference in outputs and understand why this skill is genuinely valuable.

Chatbot logic.

Students build a rule based chatbot from scratch. It takes user input and responds based on conditions. Then they upgrade it with smarter responses, better conditions and cleaner logic.

Introduction to APIs.

Students make their first API call and see live data appear in their program. No complex setup. Just a clear, working example of how applications talk to each other.

API project.

Students build a working weather application or news feed using a live API. Real data. Real output. Built by them.

END OF WEEK PROJECT:

A complete custom chatbot

A complete custom chatbot, fully functional, with conditions, responses and logic entirely written by the student.

WEEK 4 : FINAL PROJECT BUILD AND DEMO

Every student builds something real. Every student presents it.

Week four belongs entirely to the final project. No new concepts are introduced. Students take everything they have learned and channel it into one complete, polished project of their own choosing.

What gets covered :

MONDAY:

Project planning

Students choose their idea, define what it will do and break it into steps. thinkskool mentors help students pick ideas that are ambitious but achievable.

Tuesday:

Core logic

Students write the foundation of their project. The main functionality is built and working by end of session

Wednesday:

Features and refinement

Students add input and output handling, improve the user experience and make the project feel complete rather than just functional.

Thursday:

Debugging and problem solving

Students test their project, find what breaks and fix it. This is where real learning about software happens.

Friday:

Polish.

Projects are cleaned up, made presentable and tested end to end. Everything works. Everything is explainable.

Saturday morning:

Presentation preparation and mock demo

Students present to each other, get feedback and refine how they explain their work.

Demo Day

The last day is not an exam. It is a showcase.

Every student presents their project in front of peers, teachers and school leadership. They explain what they built, why they built it, how it works and what they would add next.

This is not a performance. It is proof. Proof that a student who started the month not knowing how to write a single line of code can now stand in front of a room and demo software they built themselves.

- **Every student presents their project live**
- **thinkskool certificates awarded to all participants**
- **Projects showcased to school leadership and parents**

learn beyond classrooms

We've Got Your **Back** Always.

Live mentor guidance in every class

01

Every session has a real mentor guiding you — answering questions, reviewing code, and making sure no one falls behind.

24 hour doubt assistant

02

Stuck at midnight? The assistant is right there — no waiting till next class.

Your own personal growth associate

03

Someone who tracks your journey, checks in regularly and ensures you never fall behind.

Weekly doubt sessions

04

A weekly doubt-clearing session where you can bring any problem and leave with clear understanding—ensuring every question is answered.

Progress dashboard for students and parents

05

A live view of exactly where you are — for both students and parents to stay informed.

All classes are recorded

06

Missed a class or want to revisit a concept? Every session is recorded and available for you to watch anytime
